Beschrijving

Copper tape can be an interesting addition to your toolbox. The tape itself is made of thin pure copper so its extremely flexible and can take on nearly any shape. You can easily solder to it, and the tape itself can carry current just like a wire. On the back is an electrically conductive adhesive. The adhesive can't carry significant current but it is very handy for sensing applications where you don't want to solder the copper tape.

We've seen such tape used for EMI shielding, working with EL, making capacitive touch pads, ultra-thin wiring needs, etc.

Comes in a roll 20 meters long and has conductive adhesive on one side and a protective paper backing over the adhesive.

Productinformatie

Artikelnummer	TAPE75
Merk	Merk
Is on Sale	Nee
